

To do the work for this module, you first need create a project folder called **homteq** in your personal C:\ drive or any other local drives.

TASK 01| Create a BACKGROUND IMAGE for your homteq web application

Grab a background image and save it inside the homteq project folder.

- 1) For instance, access <https://www.westminster.ac.uk/about-us/visit-us/cavendish> and locate the image for the Computer Science and Engineering subject.
- 2) With Chrome or Firefox, right-click on the image and select “Save image as”.
- 3) Save the image in the **homteq project folder** (in your C:\ personal drive) as **bgimg.jpg**

You can choose any other image if you prefer, of course.

TASK 02| Create the layout for the HEADER and the NAVIGATION BAR of your web application

- 1) Open your IDE (e.g., Notepad++, Brackets, etc.) and create a new HTML file called **headfile.html** that contains the header and the navigation bar of your web application.

NOTE

HTML (Hypertext Markup Language) is a standard markup language that is used to display web documents in a Web browser. It provides a way to create structured documents by defining elements that are then used as building blocks for the page: headings, paragraphs, lists, links, images, from elements, etc. It is used to create static pages whose content only change when the web administrator decides to change it.

Enter the code shown below.

headfile.html

```
<!--HTML document to define the layout of the header and the navigation bar-->
<link href="https://fonts.googleapis.com/css2?family=Questrial&family=Roboto&display=swap" rel="stylesheet">
<link href="https://fonts.googleapis.com/css2?family=Major+Mono+Display&display=swap" rel="stylesheet">
<link href="https://fonts.googleapis.com/css2?family=Raleway&display=swap" rel="stylesheet">

<div id="container">

    <a style="text-decoration:none" href="index.php">
        <div id="navbar">
            <div id="header">
                <h1>homteq`</h1>
                <h2>your home for home tech</h2></a>
                <h3><?php echo "London, ".date('l d F Y h:i:s');?> </h3>
            </div>
            <div id="navigation">
                <ul>
                    <div>
                        <li><a href='index.php'>Home Tech</a></li>
                        <li><a href='aboutus.php'>About Us</a></li>
                        <li><a href='signup.php'>Sign Up</a></li>
                        <li><a href='login.php'>Login</a></li>
                    </div>;
                    <div>
                        <li><a href='basket.php'>Smart Basket</a></li>
                        <li><a href='login.php'>Staff Login</a></li>
                    </div>
                </ul>
            </div>
        </div>
        <div id='content'>
```

2) Save this file in **C:\homteq** as **headfile.html** (make sure you save it as a HTML file).

TASK 03| Create the layout for the FOOTER of your web application

- 1) Create a new HTML file in your code editor called **footfile.html** that contains the footer of the web site. Enter the following code.

footfile.html

```
<!--HTML document to define the layout of the foot-->

    <link href="https://fonts.googleapis.com/css?family=Lato&display=swap" rel="stylesheet">
    <link href="https://fonts.googleapis.com/css?family=Montserrat&display=swap" rel="stylesheet">
</div>

<div id="footer">
    &copy; homteq, 2022 - 115 New Cavendish Street, London, W1W 6UW, UK
    <br>Tel: +442079115000
</div>

</div>
```

- 2) Save this file in **C:\homteq** as **footfile.html** (make sure you save it as a HTML file).

TASK 04| Create the EXTERNAL STYLE SHEET for your web application in CSS

- 1) Go to Blackboard, in the 'Tutorials' section and under 'TUTORIAL 01 – TEMPLATE PAGE', download the **mystylesheet.zip** folder and inside access the CSS file called **mystylesheet.css**.
- 2) Save this file in **C:\homteq** as **mystylesheet.css** so that you can use it as the style sheet for your web application. Make sure you save it as a *Cascade Style Sheets* file.

NOTE

CSS (Cascading Style Sheets) is a language used for defining the presentation of a web document authored in a markup language like HTML by formatting elements such as layout, colours, and fonts. It enables the separation of presentation and content. It allows the centralisation of presentation elements in a separate file, the sharing of formatting by multiple changes and edits to be made for the entire web application thus ensuring greater consistency in the look-and-feel of the application.

TASK 05 | Create the TEMPLATE for your web application by bringing together the header and navigation layout, the footer layout and the external style sheet

- 1) Create a new PHP document in your code editor called **template.php** for the template of your web application and enter the following code.

template.php

```
<?php
$pageName="template";                                //Create and populate a variable called $pageName
echo "<link rel=stylesheet type=text/css href=mystylesheet.css>";        //Call in stylesheet

echo "<title>".$pageName."</title>";                                //display name of the page as window title

echo "<body>";

include ("headfile.html");                                //include header layout file

echo "<h4>".$pageName."</h4>";                                //display name of the page on the web page

//display random text
echo "<p> Lorem ipsum dolor sit amet, consectetur adipiscing elit, sed do eiusmod tempor incididunt ut labore et dolore magna aliqua. Non consectetur a erat nam at lectus urna. Cras pulvinar mattis nunc sed blandit libero volutpat sed cras. Nunc aliquet bibendum enim facilisis gravida neque convallis a cras. Nunc consequat interdum varius sit. Nam aliquam sem et tortor consequat. Magna sit amet purus gravida. Non sodales neque sodales ut etiam sit. Tortor consequat id porta nibh venenatis. Ornare arcu odio ut sem nulla pharetra diam. Tincidunt ornare massa eget egestas purus. Pulvinar mattis nunc sed blandit libero volutpat sed. Nulla malesuada pellentesque elit eget. Varius quam quisque id diam vel quam elementum pulvinar. Aliquet eget sit amet tellus cras adipiscing enim eu turpis. Vestibulum lectus mauris ultrices eros in. Faucibus in ornare quam viverra. Hac habitasse platea dictumst vestibulum rhoncus. Parturient montes nascetur ridiculus mus. Dui accumsan sit amet nulla facilisi morbi tempus iaculis urna.";

include("footfile.html");                                //include head layout

echo "</body>";
?>
```

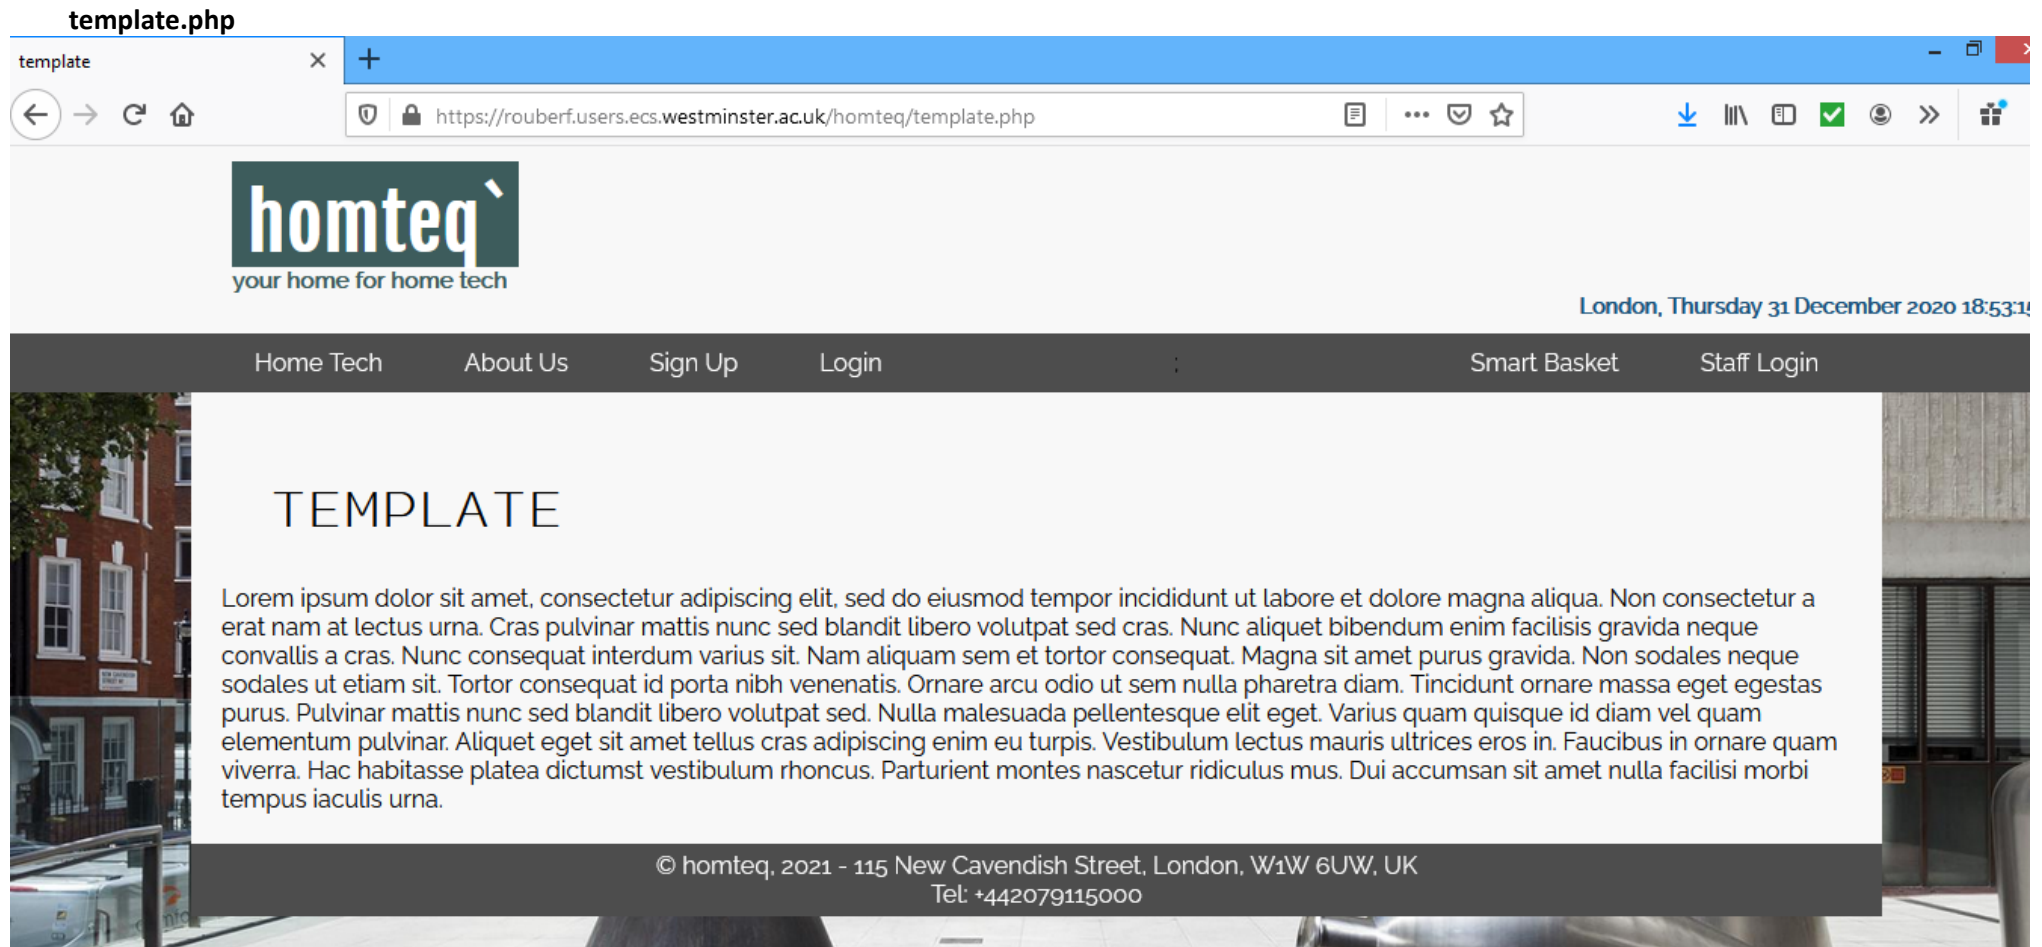

- 2) Save this file in **C:\homteq** as **template.php** (make sure you save it as a PHP file).
- 3) Access WinSCP, the Secure FTP Client, to connect to the Web Server [See sections 5 and 6 of the “Guide to Access the Module Software” available in the ‘Essentials’ section on Blackboard].

Make sure that in your **public_html** folder (right windowpane) you have created a folder called **homteq**.

- 4) Using WinSCP (or Filezilla) drag the 5 files you have just created i.e. **template.php**, **headfile.html**, **footfile.html**, **mystylesheet.css** and **bgimg.png** from **C:\homteq** (left windowpane) and drop it into the **public_html\homteq** folder (right windowpane).

Open a Web browser and enter **https://yourWestminsterID.users.ecs.westminster.ac.uk/homteq/template.php**. (make sure you use YOUR w+7digits Westminster identifier)

You should be able to see the following display (your background image may be different):

Great, you have now successfully created a template for your homteq web application!!

TASK 06| Create the ABOUT US PAGE for your web application

- 1) Go to your **C:\hometeq** and, in the same folder, copy and paste your **template.php** file and rename the copy to **aboutus.php** to create a hometeq info page. Open **aboutus.php** in your code editor and modify it as indicated below and click save.
- 2) Change the value of the variable \$pagename (line 2) from "template" to "homteq: cloud controlled tech for your home".
- 3) Instead of the random text, copy and paste the following text (inside the echo):

```
homteq is a highly-specialised online retailer that offers a wide range of devices at the most competitive prices
to make your home and your life super SMART.

SMART SECURITY
Smart-home monitoring products mean you can set up cameras to check on your home, even if you're in another country.
You can either watch a live stream through your phone or tablet, or just get alerts when the motion sensor is
triggered.

SMART ENERGY
Smart thermostat systems let you turn it off instantly from your phone - no matter where you are - or you can tell
them
when you're heading home to switch it back on, so it's warm when you get in.
They can figure out your routine and customise your heating and hot water so it's on when you need it and off when
you don't,
helping to reduce your energy bills.

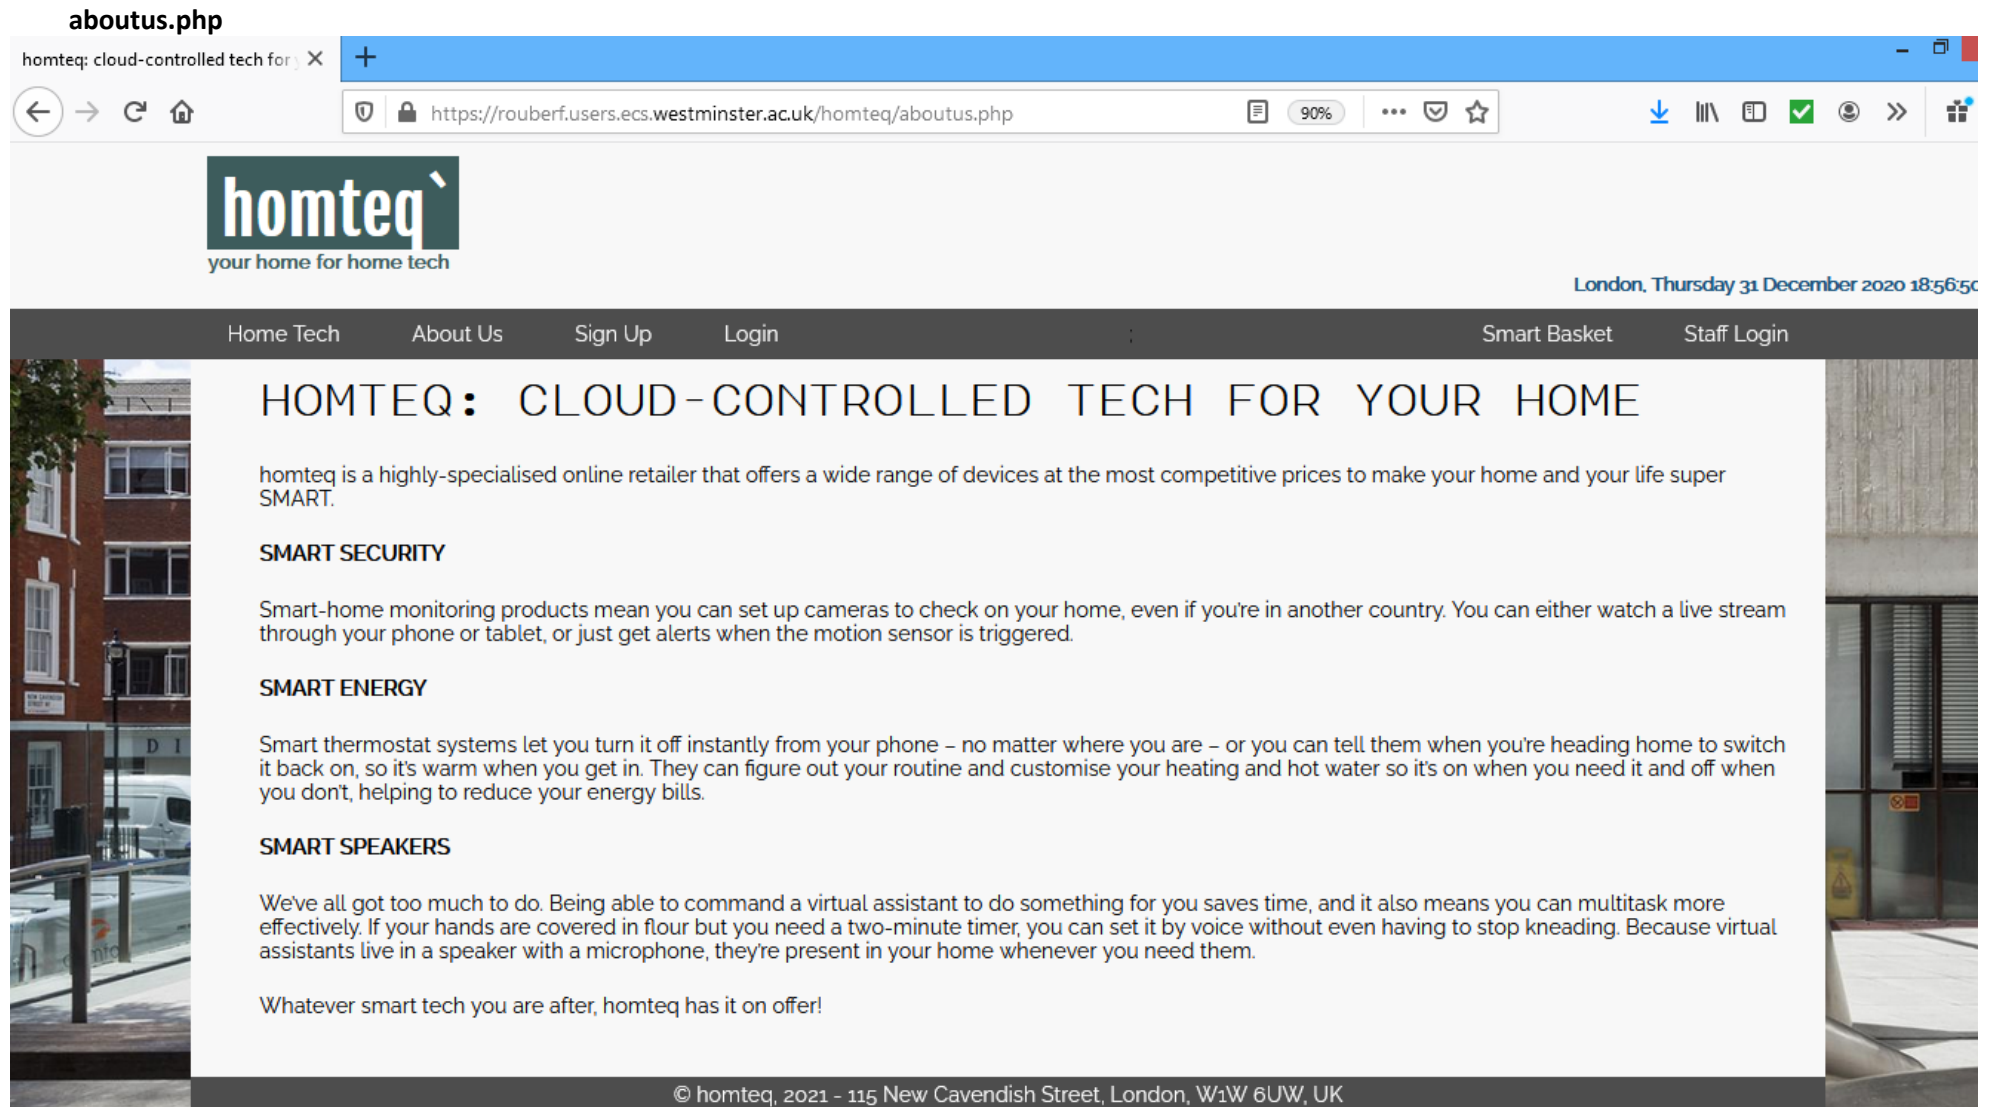

SMART SPEAKERS
We've all got too much to do.
Being able to command a virtual assistant to do something for you saves time, and it also means you can multitask
more effectively.
If your hands are covered in flour but you need a two-minute timer, you can set it by voice without even having to
stop kneading.
Because virtual assistants live in a speaker with a microphone, they're present in your home whenever you need them.

Whatever smart tech you are after, homteq has it on offer!
```

- 4) Using WinSCP drag & drop the file you have just created **aboutus.php** from **C:\homteq** (left windowpane) to **public_html\homteq** folder (right windowpane).
- 5) Click on the About Us link on the navigation bar of the Template page to view your About Us page.
- 6) To format your page as shown on the display below, enclose every paragraph within the tags `<p class='updateInfo'>` and `</p>`.

Also enclose the content you want to make bold withing the tags and

You should be able to see the following:

NOTE

PHP (Hypertext Preprocessor) is a server-side scripting language that is embedded within HTML and allows for the development of dynamic web applications that supports web-database integration. It is used to create dynamic pages whose content change depending on the user's behaviour.
