

CSS: Gradients, Animation and Transformation

In this exercise, you'll create a simple html5 page and experiment with colours, gradients, transforms and animation. Make sure that you record any difficulties you encounter while carrying out this exercise, and that you comment your code. You may use Dreamweaver or any other text editor you like.

1. Download the HTML5 page for tutorial 4.
2. Save any 3 images in your folder and modify the picture src attribute so that the page will display these pictures
3. Create a CSS rule that:
 1. change the font for all headers, make the text bold, change the font-size to 24px, center the text and add a 40px padding around it. See you results and note how that applies to both headers
 2. will target the header in the article and align the text to the left, font-size to 18px and reduce the padding to 20px.
 3. Will turn an element with the ribbon class to a ribbon on the left-hand-side corner:
 1. Rotate the element by -45 degrees
 2. Change its positioning to make it look as expected.
 3. Add a color gradient as background
 4. Add a box shadow
 4. Will target the a element in an element of class ribbon to have:
 1. A custom text colour
 2. A solid border
 3. Some padding
 4. Text effect rule to remove underline decoration
 5. Any other rule to make the ribbon pretty
 5. Will create a spinning animation. (remember to use @keyframes)
 6. Will apply this spinning to the img element. What happens?
 7. Add specificity to make only one of the images spin (without using class or id).

End of document.
