

5COSC024W Server-Side Web Development 2021-2022 TUTORIAL 03 – PRODUCT PAGE – **MODEL ANSWER**

TASK 01| Create the PRODUCT page to display the id of the selected product

- 1) Go to your **C:\homteq** folder and, in the same folder, copy and paste your **template** file and rename the copy to **prodbuy.php**.
- 2) Open **prodbuy.php** in Notepad++, change the name of the page (i.e. the variable **\$pagename**) to “A smart buy for a smart home”.
- 3) Right at the top under the PHP opening tag, add the following line to connect to the database.

```
include("db.php");
```

- 4) Locate the line of code that displays the name of the page using the <h4> tag. Right under this line, add the following code.

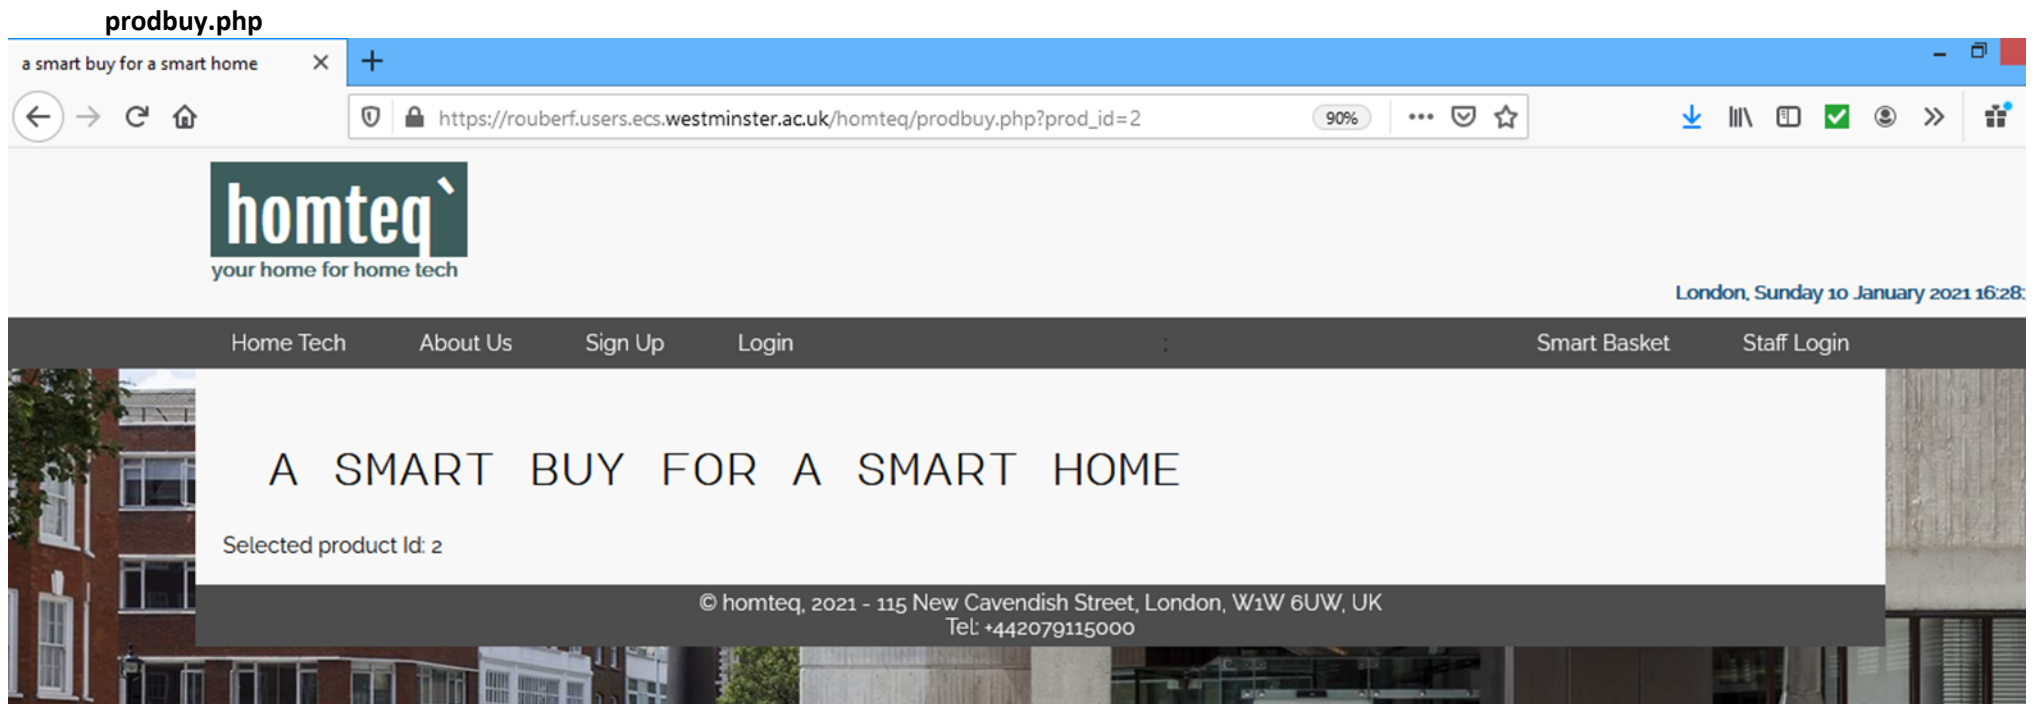

```
//retrieve the product id passed from previous page using the GET method and the $_GET superglobal variable
//applied to the query string u_prod_id
//store the value in a local variable called $prodid
$prodid=$_GET['u_prod_id'];

//display the value of the product id, for debugging purposes
echo "<p>Selected product Id: ".$prodid;
```

This code captures the value of the product id that was passed by URL as part of an anchor on index.php using a query string. It uses the **\$_GET** superglobal variable that refers to the name part of the query string created on index.php and stores the value in a new variable called **\$prodid**. It then displays the value of the product id just so that you can check that it is passed properly.

- 5) Upload the **prodbuy.php** file using WinSCP. Then access your INDEX page and select a product by clicking on an image.

You should be able to see a display similar to this:

The ID of the selected ID should appear right at the end of the URL.

The ID of the selected ID should be displayed on the page.

TASK 02 | Create the PRODUCT page to display the name, picture, description, price and stock level for the selected product

- 1) Access the **index.php** file and grab the code located right under the display of the name of the page in the <h4> tags, that starts with \$SQL and that goes all the way down to the closing of the table tag </table>.
- 2) Paste this code on the **prodbuy.php** file, right underneath the code you have just written in Task 01 to display the selected Product Id.
- 3) Modify this code to display a large image of the selected product, the name of the product, a long description and the product price, as for these instructions:
 - a) Modify the SQL query so that you retrieve the product id, the name, the large image, the long description, the price and the quantity available in stock.
 - b) Modify the SQL query by introducing a WHERE clause.
 - c) Use the product id variable (the one you used to display the id on screen) in your WHERE clause to only retrieve the record for the selected product.
 - d) Modify the display of the image by using the large image instead of the small image.
 - e) Modify the display of the description by using the long description instead of the short description.
 - f) Add a section of code to display the number of items left in stock.
- 4) Upload the **prodbuy.php** file using WinSCP. Then access your INDEX page and select a product by clicking on an image.

You should be able to see a display similar to this:

prodbuy.php

A SMART BUY FOR A SMART HOME

AMAZON Echo Show 5

See on-screen lyrics with Amazon Music. Set alarms and timers. Catch up on news highlights and film trailers. Check weather and traffic before you head out. Catch up on today's news and sports highlights. Watch film trailers. Follow step-by-step recipes. See song lyrics (UK only) and album art with Amazon Music. The perfect size to bring all this and more to any room, at a glance.

£65.99

Left in Stock: 23

On the left hand-side, the display should show the large image.

On the right-hand side, the display should show the product name, the long description, the product price, and the stock level.

Model Answer

To display the large product image, the product name, the long description, and the stock level, write the following PHP code.

```
//retrieve the product id passed from previous page using the GET method and the $_GET superglobal variable
//applied to the query string u_prod_id
//store the value in a local variable called $prodid
$prodid=$_GET['u_prod_id'];

//display the value of the product id, for debugging purposes
//echo "<p>Selected product Id: ".$prodid;

//create a $SQL variable and populate it with a SQL statement that retrieves details for the selected product
$SQL="select prodId, prodName, prodPicNameLarge, prodDescripLong, prodPrice, prodQuantity
from Product
where prodId=".$prodid;
$exeSQL=mysqli_query($conn, $SQL) or die (mysqli_error());

$arrayp=mysqli_fetch_array($exeSQL);
echo "<table style='border: 0px'>";
echo "<tr>";
echo "<td style='border: 0px'>";
echo "<img src=images/'".$arrayp['prodPicNameLarge']."' height=350 width=350>";
echo "</td>";
echo "<td style='border: 0px'>";
echo "<p><h5>".$arrayp['prodName']."'</h5></p>";
echo "<br><p>".$arrayp['prodDescripLong']."'</p>";
echo "<br><p><b>&pound>".$arrayp['prodPrice']."'</b></p>";
echo "<br><p>Number left in stock: ".$arrayp['prodQuantity']."'</p>";
echo "</td>";
echo "</tr>";
echo "</table>";
```

Also, remember to include db.php right at the top

TASK 03| Update the PRODUCT page to display a text field to purchase a number of items

You now need to create a text field in a form to allow the user to enter the number of items they are willing to purchase for the selected product.

- 1) On **prodbuy.php**, insert the following code, right underneath the code you have just written in Task 02 to display the stock level.

```
echo "<br><p>Number to be purchased: ";

//create form made of one text field and one button for user to enter quantity
//the value entered in the form will be posted to the basket.php to be processed
echo "<form action=basket.php method=post>";
echo "<input type=text name=p_quantity size=5 maxlength=3>";
echo "<input type=submit name='submitbtn' value='ADD TO BASKET' id='submitbtn'>";
//pass the product id to the next page basket.php as a hidden value
echo "<input type=hidden name=h_prodid value='.$prodid.'>";
echo "</form>";
echo "</p>";
```

This code creates a form that contains a single-line text field to allow the user to enter the thumber of items that are willing to a purchase and a button to submit the value entered.

- 2) Upload the **prodbuy.php** file using WinSCP. Then access your INDEX page and select a product by clicking on an image.

You should be able to see a display similar to this:

prodbuy.php

A SMART BUY FOR A SMART HOME

AMAZON Echo Show 5

See on-screen lyrics with Amazon Music. Set alarms and timers. Catch up on news highlights and film trailers. Check weather and traffic before you head out. Catch up on today's news and sports highlights. Watch film trailers. Follow step-by-step recipes. See song lyrics (UK only) and album art with Amazon Music. The perfect size to bring all this and more to any room, at a glance.

£65.99

Left in Stock: 23

Number to be purchased:

ADD TO BASKET

The text field can be used by users to enter the number of items they are willing to purchase for this product.

TASK 04| Update the PRODUCT page to display a drop-down list to purchase a number of items

You now need to replace the text box in the form by a dynamically-populated drop-down list that will retrieve the stock level for this product from the database and displays all the number of items in the drop-down list all the way up to the stock level.

- 1) On **prodbuy.php**, first remove the line of code that created the text field.

```
echo "<input type=text name=p_quantity size=5 maxlength=3>";
```

- 2) To create a drop-down list, you need to use the following HTML tags, as indicated in 3):

```
<select name=>
    <option value=> </option>
</select>
```

- 3) Adapt this code to display the drop-down list. This is HTML code, remember to use **echo** to output it on screen.
 - a) Use an echo statement for the <select> tag and give it a name i.e. p_quantity for product quantity.
 - b) Create a loop with a loop counter that iterates from the value 1 to value of the stock level.
(*hint: the stock level is the value that was displayed just above*)
 - c) Inside the loop, use an echo for the <option> tag.
Use the loop counter for the *value* attribute of the <option tag> and display the loop counter between the <option> tag and the </option> closing tag.
 - d) Use an echo statement for the </select> closing tag.
 - e) Keep everything else as is i.e. the display of input of type hidden (for the hidden value) and the display of input of type submit (for the submit button).
- 4) Upload the **prodbuy.php** file using WinSCP. Then access your INDEX page and select a product by clicking on an image.

You should be able to see a display similar to the one above.

Note that If there are 8 items left in stock for the selected product, you should now be able to use the drop-down menu to select to 8 items for this product.

ADD TO BASKET

The drop-down list is dynamically populated and allows the user to select a number of items all the way up to the stock level available for this product, as displayed just above the drop-down list.

Model Answer

To display the dynamically populated drop-down list, write the following PHP code.

```
echo "<br><p>Number to be purchased: ";

//create a form made of one drop-down menu and one button for user to enter quantity
//the value entered in the form will be posted to the basket.php to be processed
echo "<form action=basket.php method=post>";
echo "<select name=p_quantity>";
for ($i=1; $i<=$arrayp['prodQuantity']; $i++)
{
    echo "<option value=\".$i.\">.$i.</option>";
}
echo "</select>";
echo "<input type=submit name='submitbtn' value='ADD TO BASKET' id='submitbtn'>";
//pass the product id to the next page basket.php as a hidden value
echo "<input type=hidden name=h_prodid value=\".$prodid.\">";
echo "</form>";
echo "</p>";
```
